Cutting transport CO2 now reduces investment needs for core infrastructure

An ambitious transition to sustainable transport could be cheaper in terms of investment into core transport infrastructure than continuing as is – if action is taken now.

This is the main message of the ITF Transport Outlook 2023 report of the International Transport Forum at the OECD, presented on 24 May at the Global Summit of transport ministers in Leipzig, Germany.

All transport decarbonisation measures currently in place and already committed to will reduce global transport-related CO2 emissions by only 3% by 2050. The transport sector would miss by a wide margin the reduction needed to keep climate change in check.

If action to decarbonise transport is ratcheted up and accelerated, the transport sector can still reduce its CO2 emissions by about 80% over the next 25 years (compared to 2019).

This drop would put transport on the right path for limiting the global temperature increase to “well below” 2 degrees Celsius above pre-industrial levels, the goal of the Paris Climate Agreement.

“Reaching this high-ambition scenario requires a combination of complementary policies that successfully avoid unnecessary transport activity, shift more trips from fuel-burning to no-carbon transport and improve the efficiency of transport generally”, said ITF Secretary-General Young Tae Kim in presenting the report.

“It will be absolutely essential to quickly scale up cost-competitive technologies and fuels to move people and goods with far, far fewer emissions. We can do all this if we take more decisive action now.”

Such an accelerated transition to low- and no-carbon transport requires significant investment. Providing the core infrastructure

for the High Ambition scenario in the report, however, would require about 5% less investment than under current policies, according to the ITF’s projections.

“Freight transport will roughly double in the next 25 years if we stay on the current path, and passenger transport will grow by 79%. So we will also have to

invest heavily under this scenario to accommodate this additional demand – and, from what we know, probably more so than if we invested in a low-carbon future”, said Orla McCarthy, project lead for the ITF Transport Outlook 2023.

Delivering your strategy.

Transport CO₂ emissions to 2050: two scenarios

Cutting transport CO2 now reduces investmentFrom Page : 1

These projections consider investment needs for the core transport infrastructure – including rail lines, roads or ports – required to cater for future demand. Estimates for the extra investment needs for electric charging networks are also included in the report. This is the first edition of the ITF Transport Outlook to include estimates for infrastructure investment needs under both scenarios, to support policy decisions.

The report makes five recommendations for policy makers:

1. Develop comprehensive strategies for future mobility and infrastructure.

Instead of providing infrastructure as a reaction to predicted demand, governments

should take a “decide and provide” approach to investment, with a view to achieving certain public policy objectives.

2. Accelerate the transition to clean vehicle fleets.

Accelerating the transition towards clean vehicles and fuels requires targeted policy support with ambitious objectives and support measures. Enabling infrastructure requires additional investment.

3. Implement mode shift and demand-management policies where they are most effective.

Measures to reduce trips and travel distances, and encourage the use of more sustainable modes, work well in cities. For longer-distance travel,

a transition to cleaner vehicles and fuels is the priority.

4. Consider the additional benefits for urban areas when evaluating policies.

Many policies to decarbonise urban transport can make mobility more affordable, improve access, reduce congestion, free up space, reduce crash risks and limit air pollutants.

5. Reform vehicle taxation to capture external costs of new vehicle fleets.

Falling fuel-tax revenues will hit revenues and make fuel taxes less effective as a policy lever as vehicles become emission-free. Road pricing and congestion charging can mitigate both.

Fire Breaks Out on MSC Containership in UAE

A MSC Mediterranean Shipping Company containership has caught fire at an anchorage in the UAE.

New Delhi
Sagar Sandesh News Service

The UAE’s National Search and Rescue Center said it carried out a medical evacuation for an injured person on board to the Sheikh Shakhbout Medical City.

The condition of the person is unknown at this time.

Video released by the agency shows three tugs spraying water over the stern of the vessel.

TOMINI SHIPPING Pvt. Ltd.

A crew management centre based in Mumbai is recruiting all ranks of seafarers for Tomini Shipping’s Capesize vessel takeovers.

Urgent Requirements:

(Minimum of 1 to 2 contracts sailing experience on rank)

- Master
- Chief Engineer
- Chief Officer
- 2nd Engineer
- 2nd Officer
- 3rd Engineer
- 3rd Officer
